ES9821

32-bit High Performance 2 Channel ADC

Product Datasheet

The Sabre ES9821 is a 32-bit analog-to-digital (A/D) converter targeted for professional audio applications such as recording systems, mixer consoles and digital audio workstations (DAW), test equipment, instruments, audio processors, digital turntables, and consumer applications.

The ES9821 has 2 integrated ADCs which use ESS' patented Hyperstream® II ADC Architecture, which delivers unprecedented audio sound quality and specifications, including a DNR of +120dB & THD+N of -112dB in 2 channel mode.

The SABRE® ADC supports S/PDIF, I²S master/slave, and TDM outputs, and Hardware mode for quick configurations.

The ES9821 has built-in preprogrammed filter coefficients to match perfectly with the SABRE PRO® Series of DACs including the ES9038PRO. These complimentary filters allow for analog-digital-analog processing with the upmost audio fidelity and minimized time-domain smearing.

The ES9821 has an Ultra-Low Noise Floor Bandwidth of 200kHz. This bandwidth is up to 10 times wider than the competition, enabling higher resolution at higher sample rates.

FEATURE	DESCRIPTION
+120dB DNR per Channel w/o PLL -112dB THD+N per Channel w/o PLL	Unprecedented Dynamic Range and Ultra-Low Distortion
High Sample Rates	Up to PCM 768kHz
Customizable Filter Characteristics	8 Presets of Digital Optimal Filters
Multiple Output Formats Available	PCM, TDM, and S/PDIF Outputs are Available
I²C, SPI, and Hardware Interface Control	Configured by microcontroller or other I²C/SPI master, or pins through Hardware Mode
Ultra-Low Noise Floor Bandwidth	200kHz Bandwidth Enabling Higher Resolution at Higher Sample Rates
Integrated Low Noise ADC Reference Regulators	Reduced BOM Cost, PCB Area and Improved DNR if Required
Low Power Consumption	Simplifies Power Supply Design
Low Pin Count Standardized Packaging	5mm x 5mm, 28 pin QFN

Applications

- Professional digital audio workstations Audio Recording
- Very high-quality microphones
- High quality record turntable to USB conversion

Configuration Modes

The ES9821 has 4 control programming modes. They are controlled by the state of the MODE Pin (Pin 18).

Mode Pin	Configuration
0	I ² C Interface
Pull Low	HW control mode (see Hardware Mode Table)
Pull High	HW control mode (see Hardware Mode Table)
1	SPI interface

Table 2 – Configuration Mode

Software Mode

The ES9821 supports both I²C or SPI serial communication to configure the registers. There are two types of registers, read/write registers and read-only registers.

Required Software Mode Startup Sequence

ES9821 starts up in master mode, if a clock is on ACLK1, DATA_CLK (bit clock) and DATA1 (frame clock) will drive out PCM clocks. If using the device in slave mode, the following registers need to be set immediately after CHIP_EN is asserted to avoid two masters driving clocks into the same digital serial audio bus:

1. Register 29[1:0] = 2'b00, tri-states GPIO1 and GPIO2 outputs.
2. Register 26[7:0] = 8'h11, changes GPIO1 and GPIO2 config, from 'Aux outputs' to 'Aux inputs'
3. Register 4[7:0] = 8'h00, Sets the ES9821 from master mode to slave mode.

I²C Slave/Synchronous Slave Interface Commands

The I²C slave interface is used when the MODE Pin (Pin 18) is pulled low.

The I²C slave interface can be accessed using Pins 1, 2, 3, and 28.

- Pin 3 SDA
- Pin 2 SCL
- Pin 1 ADDR0
- Pin 28 ADDR1

The ADDR1 (Pin 28) and ADDR0 (Pin 1) determines the I²C address.

The R/W bit determines the command type, Read (1) or Write (0).

- I²C Slave Address = [5'b01000, ADDR1, ADDR0, R/W]
- I²C Synchronous Slave Address = [5'b01001, ADDR1, ADDR0, R/W]

Note: The I²C Slave interface requires an MCLK present to function, the I²C Synchronous Slave interface does not.

I ² C Slave Address	I ² C Synchronous Slave Address	ADDR1	ADDR0
0x40	0x48	Tie Low	Tie Low
0x42	0x4A	Tie Low	Tie High
0x44	0x4C	Tie High	Tie Low
0x46	0x4E	Tie High	Tie High

Table 3 – I²C Slave/Synchronous Slave Addresses

See I²C Slave/Synchronous Slave Interface Timing for timing information.

Figure 3 – I²C Read Example

Figure 4 – I²C Write Example

ES9821 Product Datasheet

SPI Slave Interface Commands

The SPI Slave interface is used when the MODE Pin (Pin 18) is pulled high.

The SPI slave interface can be accessed using Pins 1, 2, 3, and 28.

- Pin 2 SCLK
- Pin 28 SS
- Pin 3 MOSI
- Pin 1 MISO

The 4-wire SPI data format is: Command (1 byte) + Address (1 byte) + Data.

SPI commands:

- 0x01: Read
- 0x03: Write
- 0x07: Write-only Register Addresses 192-203 (0xC0 – 0xCB)

Figure 5 – SPI Single Byte Read

Figure 6 – SPI Single Byte Write

Hardware Mode

The ES9821 has pre-configured modes that can be set with external pin configuration. These modes configure the ADC for different serial data rates and set the ADC muting.

All Hardware modes use ACLK1 and use the default Minimum phase digital filter.

These modes are set with pins:

- MODE (pin 18)
- HW0 (pin 3)
- HW1 (pin 2)
- HW2 (pin 28)
- HW3 (pin 24)
- HW4 (pin 23)

Each hardware mode pin has 4 states:

- 0 – Pin directly connected to GND
- 1 – Pin directly connected to AVDD
- Pull 0 – Pin pulled to GND through 47k Ω resistor
- Pull 1 – Pin pulled to AVDD through 47k Ω resistor

Design Information

Hardware pins can be configured in 4 different ways. Each pin can be tied-high (1), pulled-high (Pull 1), pulled-low (Pull 0), or tied-low (0). HW0 and HW1 pins are always tied-high or tied-low. These 4 options also apply to MUTE_MCLK_CTRL.

The HW0 and HW1 pins never require a pull-high or pull-low resistor.

Figure 7 – Hardware Mode Pin Configurations

ES9821 Product Datasheet

Muting

MUTE_MCLK_CTRL (Pin 1) is used to control the muting of the output and MCLK rate while in Hardware Mode:

- 0 – Mute, 24.576MHz / 22.579MHz
- 1 – Unmuted, 24.576MHz / 22.579MHz
- Pull 0 – Mute, 49.152MHz / 45.158MHz
- Pull 1 – Unmuted, 49.152MHz / 45.158MHz

DC Blocking

GPIO4/HW3 (Pin 24) is used to control the ADC's DC Blocking feature while in Hardware Mode:

- 0 – DC blocking disabled
- 1 – DC blocking enabled

S/PDIF

In hardware modes #4-7, S/PDIF is encoded and output from GPIO5/HW4 in addition to the Left Justified data on the digital serial port (DCLK, DATA1, DATA2)

TDM Channel Mapping

In TDM hardware modes, ES9821 supports 4 channels, 8 channels, 16 channels and up to 32 channels per data line through autodetection. For 32 channels, GPIO5/HW4 is used to add 16 to the channel mapped. For example, Hardware modes 16 and 32 are the same hardware configuration except for GPIO5/HW4; HW mode 16 maps the outputs to slots 1 and 2, while HW mode 32 maps the outputs to slots 16 and 17.

Table 4 - Hardware Mode Configurations

Note 1: In 352.8kHz/384kHz sampling, modes 8,12,16-47 will require a 45.1584Mhz (44.1kHz sampling multiple) or 49.152MHz (48kHz) clock for a 128FS ratio (MCLK/FS ratio).

Note 2: MCLK is shown with a 48kHz clock. If 44.1kHz ratios are required, a clock of 22.5792Mhz/45.1584Mhz should be used.

Required Hardware Mode Startup Sequence

The hardware mode setup sequence is shown below with all hardware pins being defined after CHIP_EN is asserted.

Note: It is recommended that MUTE_CTRL is set low until the HW mode is finalized, then asserted last.

Digital Features

Digital Signal Path

Figure 9 – Digital Signal Path

PCM modes include the subset of I²S and Left-Justified (LJ) modes. These modes are set to carry 2 channels of converted data per digital data line, along with 2 lines of audio clocks, the bit clock, and frame clock.

To enable 32-bit output, Register 64[1:0] ENABLE_32BIT_CHx and Register 42[1:0] ADC_ENABLE_DC_BLOCK_CHx must be set.

TDM

In TDM modes, several ES9821 are used in parallel to increase the number of channels. Examples of TDM128 and TDM256 are shown below with a single 4 channel and 8 channel data line, respectively. Each ES9821 can be configured in HW or SW mode to output its data to different slots on the TDM DATA line.

Note: In hardware modes, only Left Justified TDM formats are supported. In software mode, the user can configure it to be I²S TDM format.

Figure 13 – TDM128 Mode

Figure 14 – TDM256 Mode

S/PDIF

S/PDIF is transmitted over a single signal line using dual phase encoded data, which allows for clock extraction from the data signal line.

The ES9821 has an integrated S/PDIF Encoder that can be accessed in Hardware Modes 4 through 7 and in Software Mode.

- For Hardware mode, the S/PDIF output is GPIO5/HW4 in HW modes 4-7
 - S/PDIF can be output at the same time as Left Justified data on the DCLK, DATA1, DATA2
- For Software mode, the applicable registers are:
 - Register 0[3] ENABLE_SPDIF_ENCODE
 - Enables S/PDIF encoder
 - Register 13-17 SPDIF CONFIG
 - Configures S/PDIF sub-code bits
 - Register 26-28 GPIOx CONFIG
 - Selects the S/PDIF output pin
 - Register 20[1] AUTO_FIR_SYNC = 1'b1
 - Must be set to 1'b1 when using without a frame clock (WS) on DATA1
 - Can be manually resynced by toggling Register 18[4] FORCE_FIR_SYNC

Table 5 – Standard GPIO Functions

For configuring pins as Inputs, Outputs, or Input/Outputs:

- Input pin
 - GPIOxx_IE = 1'b1 (Input Enable), Registers 31-29
 - GPIOxx_OE = 1'b0 (Output Enable), Registers 31-29
- Output pin
 - GPIOxx_IE = 1'b0
 - GPIOxx_OE = 1'b1
- In/Out pin (Master Mode)
 - GPIOxx_IE = 1'b1
 - GPIOxx_OE = 1'b1

In Master mode GPIO1 & GPIO 2 should be configured as In/Out pins

³ GPIOs can be configured using Registers 26-31

Interrupts

Interrupts are enabled using individual configuration registers specific to the interrupt function. For example, the Peak Detection interrupt is enabled via Register 43 ADC_PEAK_DETECTOR_CONFIG.

Once set, interrupts must be manually cleared via Register 12 INTERRUPT.

Register 12 INTERRUPT also allows for masking of the interrupt flag bits in Register 224 READ_SYSTEM_REGISTER_0.

Interrupts can be mapped to GPIO pins using Registers 26-28 GPIO_x/x_CONFIG.

THD Compensation

THD Compensation minimizes the non-linearities of the ADCs and the input stage overall by adding second order and third order terms:

Figure 15 - TDM Compensation

The ES9821 can help compensate for system second and third harmonic distortion. In hardware mode, the coefficients CH1_C2 = CH2_C2 = 6 and CH1_C3=CH2_C3=-13 are used, as they were best to minimize any distortion at large amplitudes.

THD compensation is always enabled but if register values are zero, it will be bypassed.

- Register 56-55: THD COMP C2 CH1
- Register 58-57: THD COMP C3 CH1
- Register 60-59: THD COMP C2 CH2
- Register 62-61: THD COMP C3 CH2

For best results, compensation coefficients should be tuned for each device in-situ.

Digital Filters

The ES9821 has 8 pre-programmed digital filters. The latency for each filter reduces (scales) with increasing sample rates. (See Register 64[4:2])

- Minimum phase (default)
- Linear phase fast roll-off apodizing
- Linear phase fast roll-off
- Linear phase fast roll-off low ripple
- Linear phase slow roll-off
- Minimum phase fast roll-off
- Minimum phase slow roll-off
- Minimum phase slow roll-off low dispersion

Note on Minimum phase filters:

Minimum phase filters are asymmetric filters that work to minimize the pre-echo of the filter, while still maintaining an excellent frequency response and they peak earlier than linear phase filters, resulting in a lower group delay. Minimum phase filters usually feature zero cycles of pre-echo, which can result in improved audio quality.

64FS Mode

When 64FS (MCLK/FS ratio) is required, it is necessary for the ES9821 to be running in 64FS Mode. If using automatic sample rate detection with Register 0[5] AUTO_FS_DETECT, 64FS Mode cannot be automatically accessed, unless Register 0[6] AUTO_FS_DETECT_BLOCK_64FS is set to 1'b0. 64FS Mode can be manually entered by setting Register 0[4] ENABLE_64FS_MODE to 1'b1, overriding the AUTO_FS_DETECT logic.

- Register 0[6] AUTO_FS_DETECT_BLOCK_64FS
 - 1'b0: Allows AUTO_FS_DETECT to enter 64FS Mode
 - 1'b1: Blocks AUTO_FS_DETECT from entering 64FS mode (default)
- Register 0[5] AUTO_FS_DETECT
 - 1'b0: Manually set sample rate with Register 1[6:0]
 - 1'b1: Automatically determine the sample rate (default)
- Register 0[4] ENABLE_64FS_MODE
 - Use for 64FS ratios, including 705.6/768kHz sample rates

This mode enables the Minimum phase 64FS filter. See filter properties.

Note: 64FS mode is not supported in Hardware mode (HW).

Minimum phase 64FS Mode Latency

The following table shows the simulated latency at 705.6kHz sampling rate. The latency was measured at the peak amplitude of the impulse response prior to being down-sampled to 1FS. Latency delay will reduce (scale) with sampling rate.

Clock Distribution

The ES9821 includes features for selecting and manipulating the input clock source.

The minimum supported external MCLK is 24.576/22.5792MHz. Below this frequency, it is required to use the APLL.

Analog Features

APLL⁴

Figure 19 – Functional Block Diagram of ES9821 APLL

The ES9821 has a built in Analog PLL (APLL) for generating frequencies that are unavailable externally. For the application note on the APLL, please ask your FAE or distributor.

For calculation of the PLL frequency output, use the following formulas:

$$F_{ref} = \left(\frac{F_{in}}{N_i} \right)$$

$$F_{vco} = \left(\frac{F_{in}}{N_i} \right) * FBDIV$$

$$N_{fb} = \frac{2^{25}}{FBDIV}$$

$$F_{out} = \left(\frac{F_{in}}{N_i} \right) * \frac{N_{fb}}{N_o}$$

Where:

- FBDIV is a 24-bit number
- PLL frequency range requirements:
 - Fref requirement: 700kHz < Fref < 12 MHz
 - Fvco requirement: 90MHz < Fvco < 110MHz
 - Fout requirement: 22.5792/24.576MHz
- Ni = input divider
 - Accessible from Reg 202-200[9:1], **PLL_CLK_IN_DIV**
- No = output divider
 - Accessible from Reg 202-200[18:10], **PLL_CLK_OUT_DIV**
- Nfb = feedback divider
 - Accessible from Reg 199-197[23:0], **PLL_CLK_FB_DIV**

PLL Registers

- NI – Register 200-202[9:1] **PLL_CLK_IN_DIV**
- NO – Register 200-202[18:10] **PLL_CLK_OUT_DIV**
- FBDIV – Register 197-199[23:0] **PLL_CLK_FB_DIV**

Clock Selection

- SEL_PLL_IN – Register 193[5:4]
 - Selection of PLL clock source (ACLK1/ACLK2/BCK or DATA_CLK)
- SEL_PLL_CLKIN – Register 193[3]
 - Enables SEL_PLL_IN source input
- SEL_SYSCLOCK_IN – Register 193[2:1]
 - Selection of the ADC & digital core clock (ACLK1/ACLK2/PLL)

⁴ Only set PLL to output 22-24MHz system clock. 45-49MHz system clock is not supported when using the PLL.

PCM/TDM Timing Requirements

MCLK edge to BCK edge

The ES9821 has a phase relationship requirement between MCLK (System Clock) and BCK (Bit Clock).

Figure 23 – 45/49MHz MCLK with BCK Phase Relationship

	Symbol	MCLK [MHz]	Minimum	Maximum	Unit
BCK “↓” to MCLK “↓”	t_{BFMF}	49.152 / 45.1584	-	11	ns
MCLK “↓” to BCK “↓”	t_{MFBF}		1.5	-	ns

Register Overview

ES9821 features two different register interfaces. There is a standard I²C slave interface, and a synchronous I²C slave interface. The standard I²C slave interface requires a system clock present through ACLK or from the PLL to write and read registers. The synchronous I²C slave interface does not require a system clock and allows for write-only configuration of the PLL registers to create a system clock from some reference clock (through DATA_CLK, or ACLK pins).

I²C Slave Interface (Device Address 0x40,0x42,0x44,0x46)

Read/Write Registers

Registers 0–65 (0x00 – 0x41) are read/write registers

Read-only Registers

Registers 224 – 240 (0xE0 – 0xF0) are read only registers.

I²C Synchronous Slave Interface (Device Address 0x48,0x4A,0x4C,0x4E)

This interface contains Write-only registers. These registers can be written even when there is no system clock present. When the device is inactive (CHIP_EN = 0), all peripherals are automatically disabled and all clocks are stopped.

Write-only Registers

Registers 192 – 204 (0xC0 – 0xCC) are write only registers.

Multi-Byte Registers

Multi-byte registers must be written from LSB to MSB. Data is latched when MSB is written.

Multi-byte registers must be read from LSB to MSB. Data is latched when LSB is read.

MSB is always stored in the highest register address.

Some RESERVED registers do not default to 0x00 and should not be modified for normal operation. If the value of the reserved registers is changed from the default state, it will be noted. Register defaults are set after CHIP_EN is asserted.

System Registers

Register 0: SYS CONFIG

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0	1'b1	1'b1	1'b0	1'b0	1'b1	1'b0	1'b0

Bits	Mnemonic	Description
[7]	SOFT_RESET	Performs soft reset to digital core except for the PLL REGISTERS. 1'b0: Disabled (default) 1'b1: Enabled
[6]	AUTO_FS_DETECT_BLOCK_64FS	Disables AUTO_FS_DETECT from using 64FS mode. 1'b0: AUTO_FS_DETECT can use 64FS mode 1'b1: AUTO_FS_DETECT is unable to use 64FS mode (default)
[5]	AUTO_FS_DETECT	1'b0: Auto FS detect is disabled 1'b1: Auto tune SELECT_ADC_NUM (SYS_CLK/CLK_ADC ratio) according to detected FS (default)
[4]	ENABLE_64FS_MODE	Enables 64FS mode to run the ADC decimation path at 64FS. 1'b0: 64FS mode disabled (default) 1'b1: 64FS mode enabled Note: This mode should be used for high sample rate (i.e., 705.6/768kHz)
[3]	ENABLE_SPDIF_ENCODE	Enables S/PDIF encoding clock. 1'b0: S/PDIF clock disabled (default) 1'b1: S/PDIF clock enabled
[2]	ENABLE_TDM_ENCODE	Enables I2S/TDM encoding clock. 1'b0: I2S/TDM clock disabled 1'b1: I2S/TDM clock enabled (default)
[1]	ENABLE_ADC	Enables ADC decimation path clocks. 1'b0: Clocks disabled (default) 1'b1: Clocks enabled
[0]	RESERVED	N/A

ES9821 Product Datasheet

Register 1: ADC CLOCK CONFIG1

Bits	[7]	[6]	[5:0]
Default	1'b0	1'b0	6'd3

Bits	Mnemonic	Description
[7]	AUTO_CH_DETECT	Enables BCK/FRAME ratio auto detect to determine TDM channels. 1'b0: Disabled (default) 1'b1: Auto detect BCK/FRAME ratio to determine the number of TDM channels
[6]	SELECT_ADC_HALF	Specifies whether to half SELECT_ADC_NUM divider. 1'b0: Divide by SELECT_ADC_NUM + 1 (default) 1'b1: Divide by half of SELECT_ADC_NUM + 1 Note: Can only produce half of an odd number divide
[5:0]	SELECT_ADC_NUM	Whole number divide value + 1 for CLK_ADC (SYS_CLK/divide_value). 6'd0: Whole number divide value + 1 = 1 6'd3: Whole number divide value + 1 = 4 (default) 6'd31: Whole number divide value + 1 = 32

Register 2: ADC CLOCK CONFIG2

Bits	[7]	[6:3]	[2:0]
Default	1'b0	-	3'd0

Bits	Mnemonic	Description
[7]	ADC_CLK_DIV2	Sets ADC clock rate 1'b0: full rate (default) 1'b1: 1/2 rate
[6:3]	RESERVED	N/A
[2:0]	SELECT_IADC_NUM	Whole number divide value + 1 for CLK_IADC (SYS_CLK/divide_value). 3'd0: Whole number divide value + 1 = 1 (default) 3'd1: Whole number divide value + 1 = 2 3'd7: Whole number divide value + 1 = 8

Register 3: I2S/TDM MASTER CLK CONFIG

Bits	[7]	[6:0]
Default	1'b0	7'd3

Bits	Mnemonic	Description
[7]	SELECT_I2S_TDM_HALF	Specifies whether to half SELECT_I2S_TDM_NUM divider. 1'b0: Divide by SELECT_I2S_TDM_NUM + 1 (default) 1'b1: Divide by half of SELECT_I2S_TDM_NUM + 1 Note: Can only produce half of an odd number divide
[6:0]	SELECT_I2S_TDM_NUM	Whole number divide value + 1 for I2S/TDM master encoding clock (SYS_CLK/divide_value). 7'd0: Whole number divide value + 1 = 1 (default) 7'd1: Whole number divide value + 1 = 2 7'd127: Whole number divide value + 1 = 128

Register 4: I2S/TDM MASTER MODE CONFIG

Bits	[7]	[6]	[5:4]	[3]	[2]	[1]	[0]
Default	1'b0	1'b0	2'd0	1'b0	1'b1	1'b1	1'b1

Bits	Mnemonic	Description
[7]	MASTER_BCK_DIV1	When enabled, master BCK is I2S/TDM master encoding clock. Otherwise, BCK is less than or equal to (I2S/TDM master encoding clock)/2 (unless when ENABLE_64FS_MODE is set). 1'b0: BCK is not I2S/TDM master encoding clock (default) 1'b1: BCK is I2S/TDM master encoding clock
[6]	MASTER_WS_IDLE	Sets the value of master WS when WS is idle. 1'b0: WS is 0 when idle (default) 1'b1: WS is 1 when idle
[5:4]	MASTER_FRAME_LENGTH	Selects the bit length in each I2S/TDM channel in master mode. 2'd0: 32-bit (default) 2'd2: 16-bit - Others: Reserved
[3]	MASTER_WS_PULSE_MODE	When enabled, master WS is a pulse signal instead of a 50% duty cycle signal. The pulse width is 1 BCK cycle. 1'b0: 50% duty cycle WS signal (default) 1'b1: Pulse WS signal
[2]	MASTER_BCK_INVERT	Inverts master BCK. 1'b0: Non-inverted 1'b1: Inverted (default)
[1]	MASTER_WS_INVERT	Inverts master WS. 1'b0: Non-inverted 1'b1: Inverted (default)
[0]	MASTER_MODE_ENABLE	Enables I2S/TDM master mode and generates master BCK and master WS. 1'b0: Disabled 1'b1: Enabled (default)

Register 5: TDM CONFIG1

Bits	[7:3]	[2]	[1]	[0]
Default	5'd0	1'b1	1'b0	1'b0

Bits	Mnemonic	Description
[7:3]	RESERVED	N/A
[2]	TDM_VALID_EDGE	Sets on which WS edge the frame starts. 1'b0: Frame starts on posedge of WS 1'b1: Frame starts on negedge of WS (default)
[1]	TDM_LJ	Sets left-justified mode. 1'b0: Not left-justified (default) 1'b1: Left-justified
[0]	TDM_LENGTH	Sets data length in each channel. 1'b0: 32-bit (default) 1'b1: 16-bit

Register 6: TDM CONFIG2

Bits	[7:5]	[4:0]
Default	3'd0	5'd1

Bits	Mnemonic	Description
[7:5]	MASTER_WS_SCALE	In I2S/TDM master mode, tunes master BCK/WS ratio by scaling master WS. It allows more TDM slots in a fixed frame. 3'd0: No scale (default) 3'd1: Scale down WS by 2 3'd2: Scale down WS by 4 3'd3: Scale down WS by 8 3'd4: Scale down WS by 16 - Others: Reserved
[4:0]	TDM_CH_NUM	Sets number of channels in each frame. 5'd0: 1 channel 5'd1: 2 channels (default) 5'd31: 32 channels

ES9821 Product Datasheet

Register 7: TDM SLOT CONFIG CH1

Bits	[7:6]	[5]	[4:0]
Default	-	1'b0	5'd0

Bits	Mnemonic	Description
[7:6]	RESERVED	N/A
[5]	SLAVE_BCK_INVERT	Slave BCK invert enable. 1'b0: Non-inverted (default) 1'b1: Invert BCK input
[4:0]	TDM_SLOT_SEL_CH1	Selects which TDM channel slot is filled by ADC Ch1 data. 5'd0: Slot 1 (default) 5'd1: Slot 2 5'd31: Slot 32

Register 8: TDM SLOT CONFIG CH2

Bits	[7:5]	[4:0]
Default	3'b000	5'd1

Bits	Mnemonic	Description
[7:5]	RESERVED	N/A
[4:0]	TDM_SLOT_SEL_CH2	Selects which TDM channel slot is filled by ADC Ch2 data. 5'd0: Slot 1 5'd1: Slot 2 (default) 5'd31: Slot 32

Register 11-9: RESERVED
Register 12: INTERRUPT

Bits	[7:6]	[5]	[4]	[3:2]	[1]	[0]
Default	-	1'b0	1'b0	-	1'b0	1'b0

Bits	Mnemonic	Description
[7:6]	RESERVED	N/A
[5]	INTERRUPT_CLEAR_CH2_CLIP_DETECT	Clears the clip detection interrupt of ADC Ch2 1'b0: Interrupt held if asserted and not masked (default) 1'b1: Interrupt cleared
[4]	INTERRUPT_CLEAR_CH1_CLIP_DETECT	Clears the clip detection interrupt of ADC Ch1 1'b0: Interrupt held if asserted and not masked (default) 1'b1: Interrupt cleared
[3:2]	RESERVED	N/A
[1]	INTERRUPT_MASK_CH2_CLIP_DETECT	Masks the clip detection interrupt of ADC Ch2 1'b0: Interrupt masked (default) 1'b1: Interrupt held if asserted
[0]	INTERRUPT_MASK_CH1_CLIP_DETECT	Masks the clip detection interrupt of ADC Ch1 1'b0: Interrupt masked (default) 1'b1: Interrupt held if asserted

Register 17-13: SPDIF CONFIG

Bits	[39:0]
Default	40'd0

Bits	Mnemonic	Description
[39:0]	SPDIF_CS	Configures SPDIF sub-code bits.

Register 18: SYNC CONTROL 1

Bits	[7]	[6]	[5]	[4]	[3:0]
Default	1'b1	1'b0	1'b0	1'b0	-

Bits	Mnemonic	Description
[7]	FORCE_PLL_LOCKED	Clock locking status control with PLL_LOCKED. 1'b0: clock locking status is determined by PLL_LOCKED 1'b1: ignores PLL_LOCKED signal from PLL and sets clock locking status to 1 (default)
[6]	SYNC_POSEDGE_FRAME	Selects which edge of the sync reference signal is used. 1'b0: Sync to negative edge of the sync reference (default) 1'b1: Sync to positive edge of the sync reference
[5]	RESERVED	N/A
[4]	FORCE_FIR_SYNC	Forces FIR to re-sync to the reference. 1'b0: No force (default) 1'b1: Forces FIR to re-sync

Register 43: ADC PEAK DETECTOR CONFIG

Bits	[7]	[6:2]	[1]	[0]
Default	1'b0	5'd10	1'b0	1'b0

Bits	Mnemonic	Description
[7]	ADC_LOCK_PEAK	Locks the stored value of the peak detectors (CH1/2) for reading back. 1'b0: Stored value is allowed to update (default) 1'b1: Stored value is locked
[6:2]	ADC_DECAY_RATE	Sets the speed at which the stored value of the peak detector will decay when the input signal is below the stored value. 5'd0: Instant decay 5'd10: Default 5'd31: Slowest decay
[1]	ADC_ENABLE_PEAK_DETECT_CH2	Enables the ADC CH2 signal peak detector. 1'b0: Disabled (default) 1'b1: Enabled
[0]	ADC_ENABLE_PEAK_DETECT_CH1	Enables the ADC CH1 signal peak detector. 1'b0: Disabled (default) 1'b1: Enabled

Register 44: ADC CH1 PEAK DETECTOR LEVEL

Bits	[7:0]
Default	8'hFF

Bits	Mnemonic	Description
[7:0]	ADC_CLIP_LEVEL_CH1	Threshold value of the CH1 clip detector. 8'h01: -48dB 8'hFF: 0dB (default)

Register 45: ADC CH2 PEAK DETECTOR LEVEL

Bits	[7:0]
Default	8'hFF

Bits	Mnemonic	Description
[7:0]	ADC_CLIP_LEVEL_CH2	Threshold value of the CH2 clip detector. 8'h01: -48dB 8'hFF: 0dB (default)

Register 47-46: ADC CH1 DC OFFSET

Bits	[15:0]
Default	16'h0000

Bits	Mnemonic	Description
[15:0]	ADC_CH1_DC_OFFSET	ADC CH1 signed DC offset. - Negative offset is valid from 16'h8000 (-30dB) to 16'hFFFF (-114dB). 16'h0000: Zero offset (default) - Positive offset is valid from 16'h7FFF (-30dB) to 16'h0001 (-114dB). $dc_offset [dB] = 20 \cdot \log_{10} \left(\frac{ ADC_CH1_DC_OFFSET }{(2^{15} - 1) \cdot 2^5} \right)$

Reflow Process Considerations

Temperature Controlled

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor to consider. The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size (RPC-2 Pb-Free Process – Classification Temperatures (T_c)). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used.

Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (Table RPC-2).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

Figure 30 – IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time bake the board according to the moisture sensitivity label instructions.

Manual

Allowed up to 2 times with maximum temperature of 350°C no longer than 3 seconds.

RPC-1 Classification reflow profile

Profile Feature	Pb-Free Assembly
Preheat/Soak	
Temperature Min (T _{smin})	150°C
Temperature Max (T _{smax})	200°C
Time (ts) from (T _{smin} to T _{smax})	60-120 seconds
Ramp-up rate (TL to Tp)	3°C / second maximum
Liquidous temperature (TL)	217°C
Time (tL) maintained above TL	60-150 seconds
Peak package body temperature (Tp)	For users Tp must not exceed the classification temp in Table RPC-2. For suppliers Tp must equal or exceed the Classification temp in Table RPC-2.
Time (tp)* within 5°C of the specified classification temperature (Tc), see Figure 28	30* seconds
Ramp-down rate (Tp to TL)	6°C / second maximum
Time 25°C to peak temperature	8 minutes maximum
* Tolerance for peak profile temperature (Tp) is defined as a supplier minimum and a user maximum.	

Table 27 – RPC-1 Classification Reflow Profile

All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), Tp shall be within $\pm 2^{\circ}\text{C}$ of the live-bug Tp and still meet the Tc requirements, otherwise, the profile shall be adjusted to achieve the latter. To accurately measure actual peak package body temperatures, refer to JEP140 for recommended thermocouple use.

Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if Tc is 260°C and time tp is 30 seconds, this means the following for the supplier and the user.

For a supplier: The peak temperature must be at least 260°C. The time above 255°C must be at least 30 seconds.

For a user: The peak temperature must not exceed 260°C. The time above 255°C must not exceed 30 seconds.

All components in the test load shall meet the classification profile requirements.

RPC-2 Pb-Free Process – Classification Temperatures (Tc)

Package Thickness	Volume mm3, <350	Volume mm3, 350 to 2000	Volume mm3, >2000
<1.6 mm	260°C	260°C	260°C
1.6 mm – 2.5 mm	260°C	250°C	245°C
>2.5 mm	250°C	245°C	245°C

Table 28 – RPC-2 Pb Free Classification Temperatures

At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (Tp) can exceed the values specified in Table RPC-2. The use of a higher Tp does not change the classification temperature (Tc).

Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or nonintegral heat sinks.

The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.
